(54) Title: MICRO-CELLULAR CLOSED-CELL SPONGE RUBBER OUTERS

WO 02/40581 A1

(57) Abstract: The invention relates to a method of making an outer tire layer on a pneumatic tire microcellular closed-cell sponge rubber, method of making the aforesaid product.

## 1 MICRO-CELLULAR CLOSED-CELL SPONGE RUBBER OUTERS

## 2

3 **FIELD OF THE INVENTION**4 The field of the present invention is rubber outer layers, and specifically micro-cellular  
5 closed-cell sponge rubber outer layers for pneumatic tires, shoe soles and other applications.

6

7 **BACKGROUND OF THE INVENTION**8 According to conventional philosophies, pneumatic rubber tire outers are made  
9 exclusively of a relatively hard durable solid rubber. However, the characteristics of relatively  
10 hard non-sponge ("solid") rubber do not favorably support the special needs of certain sports  
11 vehicles, such as mountain bikes, bicycle motorcross ("bmx") vehicles, cross-country bicycles,  
12 All Terrain Vehicles ("ATV"), and go-carts. Similarly, the characteristics of relatively hard  
13 solid rubber do not favorably support the needs of certain other types of special vehicles,  
14 including for example, wheelchairs, baby joggers, skateboards, rollerblades, scooters,  
15 motorcross vehicles, and others.16 Pneumatic mountain bicycle tire outers have conventionally been made with relatively  
17 hard durable solid rubber. Relatively hard durable solid rubber is used in making the outers for  
18 such tires under the conventional thinking that because a mountain biking tire is subjected to  
19 high-friction conditions, the characteristics of relatively hard durable solid rubber will provide  
20 long wear.21 There are a number of problems, however, with such tires. For example, relatively hard  
22 solid rubber does not have a high-friction coefficient – in most cases, the harder the rubber, the  
23 lower the friction coefficient of the rubber. Therefore, most conventional relatively hard solid  
24 rubber tires do not provide good traction characteristics.25 Another problem with pneumatic tires made with relatively hard solid rubber outers is  
26 that they do not exhibit good shock absorption characteristics. In the case of mountain bikes,  
27 shock absorption is a critical factor in the design of such bikes. Mountain bikes can cost ten  
28 times the amount of a regular street bicycle – much of the cost being devoted to providing  
29 highly-advanced shock absorption characteristics to various structural features of the bicycle.  
30 After spending thousands of dollars on a highly-advanced shock absorbing bike frame, the  
31 mountain biker then mounts pneumatic tires made of relatively hard solid rubber that  
32 characteristically exhibit low shock-dampening characteristics – that is, they bounce.

1       Soft rubber exhibits higher-friction coefficient characteristics than harder rubber.  
2       However, soft rubber does not wear well and further does not exhibit significantly reduced  
3       dampening characteristics as compared to harder rubber.

4       Sponge rubber exhibits high-dampening and high-friction coefficient characteristics.  
5       However, a sponge rubber made using very soft rubber would not exhibit durability  
6       characteristics necessary for pneumatic tires.

7       As with pneumatic tire rubber outers, rubber outers, that is, an outer layer of rubber, in  
8       other applications that are often subjected to high-wear, high-friction conditions, such as, for  
9       example, shoe sole outers, are often made with relatively hard durable solid rubber according to  
10      the conventional thinking that the relatively hard durable solid rubber will provide long wear.  
11      However, as with tires, shoe sole outers (outsoles) and other rubber outers made according to  
12      this conventional thinking do not exhibit high-friction coefficient or shock-absorbing  
13      characteristics.

14

## 15      **SUMMARY OF THE INVENTION**

16      The present invention provides a method for formulating with relatively hard solid  
17      rubber, a micro-cellular closed-cell sponge rubber outer such as for use as an outer tire layer (a  
18      “tire outer”) on pneumatic tires or for use as a component of shoe sole outers, said method  
19      comprising blowing a relatively hard non-sponge (or “solid”) rubber having a first hardness  
20      scale measurement with a micro-cellular closed-cell inducing blowing agent to produce a micro-  
21      cellular closed-cell sponge rubber with a second hardness scale measurement, wherein the  
22      second hardness scale measurement is less than the first hardness scale measurement.

23      The term “outer” is used herein to mean an outer layer. In the case of pneumatic tires, an  
24      outer layer of rubber (a tire “outer”) is bonded to a non-stretch or limited-stretch pneumatic tire  
25      lining. In the case of shoe soles, an outer layer of shoe sole material (a shoe sole outer,  
26      sometimes referred to in the shoe industry as an outsole) is fastened or vulcanized to a shoe  
27      upper, or is fastened or vulcanized to a midsole and shoe upper. The way in which a tire outer is  
28      fastened to a pneumatic tire lining is not a limitation of the present invention. The way in which  
29      a shoe sole outer is fastened or vulcanized to a shoe upper, or to a midsole and shoe upper, or to  
30      any other inner-sole, midsole, and shoe upper configuration is not a limitation of the present  
31      invention.

32      The words “non-sponge” and “solid” are used interchangeably in the disclosure of this  
33      invention. It will be understood by someone with ordinary skill in the art that blowing a

1 relatively hard non-sponge solid rubber with a micro-cellular closed-cell inducing blowing agent  
2 will produce a micro-cellular closed-cell rubber having higher dampening characteristics and a  
3 higher friction coefficient than the solid rubber from which the sponge rubber is produced. An  
4 outer tire layer so formulated would be for use on pneumatic tires for any of a variety of  
5 vehicles, including but not limited to: mountain bikes, cross-country bicycles, All Terrain  
6 Vehicles ("ATV"), off-road vehicles, go-carts, wheelchairs, baby joggers, skateboards,  
7 rollerblades, scooters, motorcross vehicles, and others.

8 The present invention also provides a method for manufacturing pneumatic rubber tires,  
9 said method comprising vulcanizing an outer tire layer of micro-cellular closed-cell sponge  
10 rubber formulated from relatively hard non-sponge rubber, and bonding the outer tire layer to a  
11 non-stretch or limited-stretch pneumatic tire lining. Pneumatic tire linings, often made of nylon  
12 material, are sometimes referred to as "non-stretch." However, it will be understood by  
13 someone with ordinary skill in the art of tire making that nylon and other pneumatic tire lining  
14 material "stretch" to a limited extent. Therefore, reference herein to "non-stretch" or "limited-  
15 stretch" pneumatic tire lining material means pneumatic tire lining material, such as nylon, that  
16 stretches only to a limited extent.

17 The present invention also provides a method for manufacturing pneumatic rubber tires,  
18 said method comprising vulcanizing an outer tire layer comprising micro-cellular closed-cell  
19 sponge rubber formulated from relatively hard non-sponge rubber, said outer tire layer further  
20 comprising non-sponge rubber, and bonding the outer tire layer to a non-stretch or limited-  
21 stretch pneumatic tire lining.

22 The present invention provides a method for manufacturing pneumatic rubber tires, said  
23 method comprising molding an outer tire layer of micro-cellular closed-cell sponge rubber  
24 formulated from relatively hard non-sponge rubber, and bonding the molded outer tire layer to a  
25 non-stretch or limited-stretch pneumatic tire lining.

26 The present invention further provides a method for manufacturing pneumatic rubber  
27 tires, said method comprising bonding an outer tire layer of micro-cellular closed-cell sponge  
28 rubber formulated from relatively hard non-sponge rubber to a non-stretch or limited-stretch  
29 pneumatic tire lining.

30 The present invention further provides a method for manufacturing pneumatic rubber  
31 tires, said method comprising bonding an outer tire layer comprising micro-cellular closed-cell  
32 sponge rubber formulated from relatively hard non-sponge rubber and further comprising non-  
33 sponge rubber, to a non-stretch or limited-stretch pneumatic tire lining. The present invention

1 also provides a pneumatic rubber tire, said pneumatic rubber tire comprising an outer tire layer  
2 comprising micro-cellular closed-cell sponge rubber formulated from relatively hard non-sponge  
3 rubber wherein the outer tire layer is bonded to a non-stretch, or limited-stretch, pneumatic tire  
4 lining.

5 The present invention also provides a pneumatic rubber tire, said pneumatic rubber tire  
6 comprising an outer tire layer comprising micro-cellular closed-cell sponge rubber formulated  
7 from relatively hard non-sponge rubber and further comprising non-sponge rubber wherein the  
8 outer tire layer is bonded to a non-stretch, or limited-stretch, pneumatic tire lining.

9 The present invention further provides a method for manufacturing shoe sole outers, said  
10 method comprising vulcanizing micro-cellular closed-cell sponge rubber formulated from  
11 relatively hard non-sponge rubber with non-sponge rubber in a shoe sole outer mold.

12 The present invention further provides a shoe sole outer (also sometimes referred to as  
13 an outsole), said shoe sole outer comprising micro-cellular closed-cell sponge rubber formulated  
14 from relatively hard non-sponge rubber and further comprising non-sponge rubber.

15

#### 16 **BRIEF DESCRIPTION OF THE DRAWINGS**

17 These and other features of the present invention are more fully set forth in the following  
18 description of exemplary embodiments of the invention. The description is presented with  
19 reference to the accompanying drawings in which:

20 FIG. 1 is a high level flow diagram depicting the logic steps to determining a proportion  
21 of blowing and a rubber formulation with which to manufacture a rubber for a particular  
22 intended purpose;

23 FIG. 2 is a graphic representation that depicts, under extreme magnification, an  
24 exemplary uneven density distribution of gas pockets that sometimes results from micro-  
25 cellular, closed-cell sponge rubber vulcanization;

26 FIG. 3 is a cross-sectional view of an exemplary outer tire mold into which rubber is  
27 placed to form a tire outer in an exemplary embodiment of the present invention;

28 FIG. 4 is a cross-sectional view of an exemplary single-rubber tire outer in which micro-  
29 cellular closed-cell sponge rubber forms a tire outer in an exemplary single-rubber tire outer  
30 embodiment of the present invention;

31 FIG. 5 is a cross-sectional view of an exemplary multi-rubber tire outer in which non-  
32 sponge rubber forms outer tire tread lugs and micro-cellular closed-cell sponge rubber forms

1 inner tire tread lugs in a first exemplary multi-rubber tire outer embodiment of the present  
2 invention;

3 FIG. 6 is a cross-sectional view of an exemplary multi-rubber tire outer in which non-  
4 sponge rubber forms inner tire tread lugs micro-cellular closed-cell sponge rubber forms outer  
5 tire tread lugs in a second exemplary multi-rubber tire outer embodiment of the present  
6 invention;

7 FIG. 7 is a cross-sectional view of an exemplary assembled bicycle tire comprising a  
8 multi-rubber tire outer in a first alternative exemplary embodiment of the present invention;

9 FIG. 8 is a top view of an exemplary shoe mold;

10 FIG. 9 is a cross-sectional view of a portion of the exemplary shoe mold;

11 FIG. 10 is a cross-sectional view of a portion of an exemplary shoe sole outer  
12 comprising micro-cellular closed-cell sponge rubber and non-sponge rubber; and

13 FIG. 11 is a bottom view of an exemplary shoe sole outer comprising micro-cellular  
14 closed-cell sponge rubber and non-sponge rubber.

15

## 16 DETAILED DESCRIPTION OF THE INVENTION

17 The making of sponge rubber is well known in the art of rubber making. One of a  
18 variety of "blowing agents" is used in the rubber formulation process to create a multitude of  
19 gas pockets in the final rubber product.

20 Instead of using soft rubber, according to the present invention, blowing agents are  
21 added to relatively hard solid rubber formulations to create a relatively hard rubber sponge  
22 rubber. The relatively hard rubber sponge rubber is then used to make an outer tire layer for  
23 pneumatic tires. The exemplary description of methods of formulating relatively hard rubber  
24 sponge rubber for, and manufacturing, a mountain bike tire is illustrative and is not a limitation  
25 of the invention.

26 Various blowing agents provide different types of results. Proportions being equal, some  
27 blowing agents tend to create a smaller number of, but large-sized, air or gas pockets; whereas  
28 other blowing agents tend to create a higher number of, but smaller-sized air or gas pockets.

29 Some blowing agents produce what is known in the art as "open cell" sponge. Such  
30 blowing agents produce air pockets that are open. Such open air pockets can be useful when the  
31 rubber is intended for water absorption products.

32 Other blowing agents produce what is known as "closed cell" sponge. Such blowing  
33 agents produce gas pockets in rubber such that each gas pocket is encapsulated with the rubber.

1        The present invention provides that blowing agents that produce micro-cellular, closed-  
2    cell sponge are used to "blow" relatively hard solid rubber. The book entitled Blue Book 1997:  
3    Materials, compounding ingredients, machinery and services for the rubber industry, Job H.  
4    Lippincott publisher, published by Rubber World magazine, a Lippincott & Peto publication,  
5    contains a list of rubber blowing agents on pages 312-318, the factual content of which is  
6    incorporated by reference herein for all purposes as if fully stated here and selected portions of  
7    the factual content of which are provided below.

8        The Blue Book lists a number of blowing agents by Tradename, composition and  
9    Supplier; properties and function and compounding are described for each blowing agent listed.  
10   The Blue Book list of Blowing Agents is extensive. Accordingly, exemplary blowing agent  
11   compositions are identified below. The following list of exemplary micro-cellular, closed-cell  
12   sponge inducing blowing agent compositions is illustrative and is not a limitation of the blowing  
13   agents that can be used in the present invention.

14       Exemplary blowing agent compositions listed in the Blue Book that produce micro-  
15   cellular, closed-cell sponge include: Azodicarbonamide (including Activated and Modified  
16   forms), p-toluene sulfonylhydrazide (TSH), Sodium bicarbonate and Dinitroso pentamethylene  
17   tetramine (DNPT). Someone with ordinary skill in the art of rubber making will understand that  
18   use of other micro-cellular, closed-cell sponge inducing blowing agent compositions is possible  
19   without deviating from the spirit of the invention. Someone with ordinary skill in the art of  
20   rubber making will further understand that considerations for selection of a blowing agent  
21   include the form (dust, paste, etc.) preferred, and the temperature for vulcanizing a particular  
22   rubber formulation. Further, the function and compounding requirements are specific to each  
23   blowing agent composition, and to some extent, to each formulation marketed under the  
24   respective Tradenames listed in the Blue Book. Someone with ordinary skill in the art of rubber  
25   making will understand the blowing agent-specific function and compounding requirements.

26       The Blue Book identifies a number of Tradenames under which Activated  
27   Azodicarbonamide can be purchased, including, among others: Celogen 754 (Uniroyal  
28   Chemical, supplier), Celogen 785A (Uniroyal Chemical, supplier), and Celogen 700 (Uniroyal  
29   Chemical, supplier). The Blue Book identifies a number of Tradenames under which  
30   Azodicarbonamide can be purchased, including, among others: Celogen AZ (Uniroyal  
31   Chemical, supplier), Expance AZ (Proquitec Industrie, supplier), Porofor ADC/F (Bayer Fibers,  
32   Organics & Rubber Division, supplier), Porofor ADC/M (Bayer Fibers, Organics & Rubber  
33   Division, supplier), and Unicell D (Dong Jin (USA), supplier). The Blue Book identifies a

1 number of Tradenames under which Modified Azodicarbonamide can be purchased, including,  
2 among others: Ficel (Schering Berlin, supplier) and Unicell DX (Dong Jin (USA), supplier).  
3 The Blue Book, page 316, identifies the Properties of one Azodicarbonamide composition,  
4 marketed under the Tradename of Porofor ADC/M as: "SP gr. 1.6. Yellow powder.  
5 Decomposition temp. not below 205°C. Volume of gas released about 220 ml/g." The Blue  
6 Book, page 316, identifies the Function and Compounding of Porofor ADC/M as: "A nitrogen  
7 liberating blowing agent for the manufacture of odorless, cellular vulcanizates. Especially  
8 suitable for the manufacture of articles to be cured at relatively high temperatures (e.g. micro-  
9 cellular profiles in LCM devices.)"

10 The Blue Book identifies a number of Tradenames under which p-toluene  
11 sulfonylhydrazide can be purchased, including, among others: Biofoam SH (Rit-Chem supplier);  
12 Celogen TSH (Uniroyal Chemical, supplier); Expencel TSH (Proquitec Industira, supplier); and  
13 Unicell H (Dong Jin (USA), supplier). The Blue Book, page 314, describes the properties for  
14 one of the preceding exemplary TSH blowing agent compositions (Celogen TSH) as: "Sp gr.  
15 1.42. Cream colored crystalline powder. Melting point, 125-150°C (257-302°F).  
16 Decomposition range, 110-120°C (230-250°F). Amount of nitrogen gas, 115 cc/gm STP." The  
17 Blue Book, page 314, further describes the function and compounding for one of the preceding  
18 exemplary TSH blowing agent compositions (Celogen TSH) as: "A low temperature blowing  
19 agent for NR, SBR, NBR, LLR, CR and silicone rubber. Nitrogen blowing agent; produces  
20 odorless cellular rubber goods; nondiscoloring and nonstaining; slightly activating to the cure.  
21 Celogen TSH is a superior blowing agent for the expansion of liquid polysulfide rubbers at room  
22 temp."

23 The Blue Book identifies a number of Tradenames under which Sodium bicarbonate can  
24 be purchased, including, among others: Dynacarb (Littlern Corporation, supplier). The Blue  
25 Book, page 314, describes the properties for Dynacarb as: "Sp gr. 2.18 free flowing, non-dusting  
26 fine white powder." The Blue Book, page 314, describes the function and compounding for  
27 Dynacarb as: "Small particle size for sponge compounds."

28 The Blue Book identifies a number of Tradenames under which Dinitroso  
29 pentamethylene tetramine (DNPT) can be purchased, including, among others: Opex (Uniroyal  
30 Chemical, supplier), and Unicell G (Dong Jin (USA), supplier). The Blue Book, page 316,  
31 describes the properties for Opex as: "DNPT on an inert carrier – 80% active. Pale yellow  
32 powder. Opex is flammable and should be kept away from all sources of heat, open flame and  
33 sparks. Strong acids and acidic salts will cause rapid decomposition of Opex. Incompatible

1 with oxidizing and reducing agents." The Blue Book, page 314, describes the function and  
2 compounding for Opex as: "Especially effective in pressure procured closed cell applications of  
3 SBR, CR, NBR and EPDM. Also, imparts a fine cellular structure in extrusion processes. At  
4 cure temperature of 130°C (288°F) and higher. Opex and some of its decompositon products  
5 show a definite cure activation in both natural and synthetic rubber sponge. Used in the  
6 manufacture of open and closed cell sponge in a wide range of densities with uniform cell  
7 structure."

8 The proportion of the blowing agent used and the particular rubber formulation used  
9 determines the final dampening and friction coefficient characteristics of the sponge rubber  
10 produced. Performance characteristics desirable for an intended use of the rubber to be  
11 produced directs the proportion of the blowing agent and the particular rubber formulation to be  
12 used.

13 The hardness of rubber can be measured with a device known in the art as a  
14 "durometer." A standard hardness scale known in the art is the "Shore A" scale. In an  
15 exemplary embodiment of the invention, a rubber with a hardness of approximately 65 to 70 on  
16 the Shore A scale is blown with a micro-cellular, closed-cell sponge inducing blowing agent  
17 until the resulting sponge rubber has a hardness of approximately 35 to 40 on the Shore A scale.

18 FIG. 1 is a high level flow diagram depicting the logic steps to determining a proportion  
19 of blowing and a rubber formulation with which to manufacture a rubber for a particular  
20 intended purpose. The present invention provides for determining 1 a set of performance  
21 characteristics desirable for an intended use of a pneumatic rubber tire, said set of performance  
22 characteristics comprising a resiliency factor, a dampening factor, and a relative hardness factor.  
23 Then a rubber formulation is determined 2 that exhibits a level of rubber resiliency  
24 corresponding to said resiliency factor. A blown rubber formulation is then determined 3 that  
25 would have a level of dampening corresponding to said dampening factor and a hardness  
26 measurement corresponding to said relative hardness factor. The determined rubber formulation  
27 is then blown 4 with a micro-cellular, closed-cell sponge inducing blowing agent to produce the  
28 blown rubber formulation having a level of dampening corresponding to said dampening factor  
29 and a hardness measurement corresponding to said relative hardness factor. (Rubbers that could  
30 be used would include SBR rubber (a synthetic "natural" rubber available from various  
31 suppliers), Stealth grade C4 (Supplier: Stone Age Equipment, Inc., Redlands, California, USA),  
32 Stealth grade S1 (Supplier: Stone Age Equipment, Inc., Redlands, California, USA), and natural  
33 rubber (available from various suppliers).

1        In one exemplary outer tire layer embodiment, blowing agent Celogen AZ (Uniroyal  
2        Chemical, supplier) is used to blow Stealth grade C4 (Supplier: Stone Age Equipment, Inc.,  
3        Redlands, California, USA) rubber with a hardness of approximately 79 on the Shore A scale  
4        down to a hardness of approximately 40 on the Shore A scale. In a second exemplary outer tire  
5        layer embodiment, blowing agent Celogen AZ (Uniroyal Chemical, supplier) is used to blow  
6        Stealth grade S1 (Supplier: Stone Age Equipment, Inc., Redlands, California, USA) rubber with  
7        a hardness of approximately 72 down to a hardness of approximately 40 on the Shore A scale.  
8        In a third outer tire layer embodiment, blowing agent Celogen AZ (Uniroyal Chemical, supplier)  
9        is used to blow SBR rubber (a synthetic "natural" rubber available from various suppliers) with  
10      a hardness of approximately 70 on the Shore A scale down to a hardness of approximately 40 on  
11      the Shore A scale.

12      For example, in the case of downhill mountain bike racing, a tire, according to the  
13      invention, a micro-cellular, closed-cell sponge inducing blowing agent is used to blow a  
14      relatively hard, low resilience, high dampening rubber to create an outer tire layer of micro-  
15      cellular, closed-cell sponge. In an exemplary embodiment of a downhill mountain bike racing  
16      tire, a rubber with a hardness of approximately 60 to 65 on the Shore A scale is blown with a  
17      micro-cellular, closed-cell sponge inducing blowing agent until the resulting sponge rubber has  
18      a hardness of approximately 30 to 35 on the Shore A scale. Then, according to the invention,  
19      the outer tire layer is bonded to a non-stretch or limited-stretch pneumatic tire lining. Non-  
20      stretch, or limited-stretch, pneumatic tire linings are often made of nylon. Techniques for  
21      bonding a rubber layer to a non-stretch, or limited-stretch, nylon pneumatic tire lining are well  
22      known in the art of tire making.

23      In the case of cross-country bicycle racing, a tire with low rolling resistance is desirable.  
24      According to the invention, a micro-cellular, closed-cell sponge inducing blowing agent is used  
25      to blow a relatively hard, higher resiliency rubber to create an outer tire layer of micro-cellular,  
26      closed-cell sponge. In an exemplary embodiment of a cross-country bicycle racing tire, a rubber  
27      with a hardness of approximately 70 to 75 on the Shore A scale is blown with a micro-cellular,  
28      closed-cell sponge inducing blowing agent until the resulting sponge rubber has a hardness of  
29      approximately 40 to 45 on the Shore A scale. Then, according to the invention, the outer tire  
30      layer is bonded to a non-stretch, or limited stretch, pneumatic tire lining.

31      In the case of wet surface cycling, it is desirable to maximize surface contact. According  
32      to the invention, a micro-cellular, closed-cell sponge inducing blowing agent is used to blow a  
33      relatively hard non-sponge rubber to a lower level of hardness on the Shore A scale. The result

1 is a sponge rubber with a higher density of micro-cellular closed-cell gas pockets. In an  
2 exemplary embodiment of a wet surface cycling tire, a rubber with a hardness of approximately  
3 60 to 65 on the Shore A scale is blown with a micro-cellular, closed-cell sponge inducing  
4 blowing agent until the resulting sponge rubber has a hardness of approximately 30 to 35 on the  
5 Shore A scale. Then, according to the invention, the outer tire layer is bonded to a non-stretch,  
6 or limited-stretch, pneumatic tire lining.

7 As part of the vulcanization process for a micro-cellular, closed-cell sponge made  
8 according to the present invention, a "skin" will sometimes form on the outer surface of the  
9 rubber. Such a skin sometimes has fewer micro-cellular, closed-cell sponge gas pockets than  
10 rubber farther from the surface. FIG. 2 depicts, under extreme magnification, an uneven  
11 distribution of gas pockets. FIG. 2 depicts a reduction in the density of gas pockets from the  
12 interior 5 of the rubber, to the exterior 6 of the rubber in an exemplary micro-cellular, closed-  
13 cell sponge rubber vulcanization process. In some other alternative micro-cellular, closed-cell  
14 sponge rubber vulcanization processes, the density of gas pockets is more or less evenly  
15 distributed.

16 FIG. 3 is a cross-sectional view of an exemplary outer tire mold 10-10' into which  
17 rubber is placed to form a tire outer in an exemplary embodiment of the present invention. As  
18 depicted in FIG. 3, a typical tire mold comprises two separate pieces, e.g., 10 and 10', that are  
19 placed together. In an exemplary single-rubber outer embodiment of the present invention,  
20 micro-cellular closed-cell sponge rubber is placed in the mold to form a tire outer. As one with  
21 ordinary skill in the rubber arts will understand, pre-cured rubber is clay-like. To form a tire  
22 outer, rubber is placed in a mold, is pressed so that the rubber "flows" into the mold, and is then  
23 cured in a vulcanization process.

24 FIG. 4 is a cross-sectional view of an exemplary single-rubber tire outer 20 in which  
25 micro-cellular closed-cell sponge rubber 80 forms a tire outer in an exemplary single-rubber tire  
26 outer embodiment of the present invention. As depicted in FIG. 4, as will be understood by  
27 someone with ordinary skill in the bicycle tire-making art, a bead, e.g., 30 and 31, such as one  
28 made with Kevlar or other aramid fiber, is inserted in the rubber placed in the mold 10 (FIG. 3).  
29 Further, as depicted in FIG. 3, the exemplary mold 10 provides detents 14 with which to form  
30 tire outer protrusions, e.g., 32 and 33 as depicted in FIGS. 4 through 7.

31 Additional modifications and variations of the above-described embodiments will be  
32 apparent to those with ordinary skill in the art without departing from the spirit of the invention.  
33 For example, it will be understood by someone with ordinary skill in the art that, without

1 departing from the spirit of the invention, an outer tire layer comprising multiple types of  
2 rubber, each type of rubber provided in one or more particular areas of the outer surface of the  
3 tire, can be made using vulcanization. FIG. 5 is a cross-sectional view of an exemplary multi-  
4 rubber tire outer 40 in which hard, non-sponge rubber 60 forms outer tire tread lugs, 70-71  
5 respectively, and micro-cellular closed-cell sponge rubber 80 forms inner tire tread lugs 50 in a  
6 first exemplary multi-rubber tire outer embodiment of the present invention.

7 To form the exemplary multi-rubber tire outer 40 depicted in FIG. 5, micro-cellular  
8 closed-cell sponge rubber 80 would be placed in the inner tire tread lug indentations 11 of the  
9 exemplary outer tire mold 10 as depicted in FIG. 3; hard, non-sponge rubber 60 would be placed  
10 in the outer tire tread lug indentations 12 of the exemplary outer tire mold 10 as depicted in FIG.  
11 3. The rubber in the mold would then be cured using vulcanization. The rubbers comprising the  
12 micro-cellular closed-cell sponge rubber 80 and the hard, non-sponge rubber 60 would be  
13 selected according to criteria known in the art such that the two rubbers 80 and 60 would knit  
14 together forming long chains of molecules.

15 One selection criteria for selecting the two rubbers 80 and 60 that would knit together  
16 would be to blow rubber having the same composition as the non-sponge rubber 60 with a  
17 micro-cellular closed-cell inducing blowing agent to produce the micro-cellular closed-cell  
18 sponge rubber 80.

19 FIG. 6 is a cross-sectional view of an exemplary multi-rubber tire outer 100 in which  
20 hard, non-sponge rubber 60 forms inner tire tread lugs 50 and in which micro-cellular closed-  
21 cell sponge rubber 80 forms outer tire tread lugs 70-71 in a second exemplary multi-rubber tire  
22 outer embodiment of the present invention.

23           Once a tire outer, e.g., 20, 40, 100 has been formed according to the present invention,  
24 the tire outer, e.g., 20, 40, 100 is bonded to a non-stretch or limited-stretch pneumatic tire lining.  
25 The resulting bonded tire assembly 200 as depicted in FIG. 7 can be assembled with other parts,  
26 e.g., a tire rim 120 to form a bicycle tire 300 as depicted in FIG. 7. FIG. 7 is a cross-sectional  
27 view of an exemplary assembled bicycle tube tire 300 comprising a multi-rubber tire outer 40  
28 bonded to a pneumatic tire lining to form a bonded tire assembly 200 in the first alternative  
29 exemplary embodiment of the present invention. As depicted in FIG. 7, a tube 140 is filled with  
30 air to inflate the outer bonded tire assembly 200. In a tubeless pneumatic tire (not pictured), air  
31 used to inflate the outer bonded tire assembly 200 is sealed between the rim 120 and the tire  
32 outer protrusions 32 and 33.

1        The present invention further provides a method for manufacturing shoe sole outers, e.g.,  
2        220 as shown in FIGS. 10-11. The present invention further provides a shoe sole outer, e.g., 220  
3        that is made by vulcanizing micro-cellular closed-cell sponge rubber 222 (as depicted in FIGS  
4        10-11) formulated from relatively hard non-sponge rubber with non-sponge rubber 221 (as  
5        depicted in FIGS. 10-11) in a shoe sole outer mold 210 (as depicted in FIGS. 8-9).

6        FIG. 8 is a top view of an exemplary shoe mold and FIG. 9 is a cross-sectional view of a  
7        portion of the exemplary shoe mold. In a way similar to that described above for placing clay-  
8        like uncured rubber in a tire mold, uncured solid rubber would be placed in the shoe sole "tread"  
9        indentations 201 in the mold 200; uncured micro-cellular closed-cell sponge rubber would be  
10      placed in the shoe sole mold 200 on top of the previously placed uncured solid rubber. The  
11      rubber would then be pressed to flow into the mold. The molded shoe outer would then be  
12      cured using vulcanization so that non-sponge solid rubber would "knit" with the micro-cellular  
13      closed cell sponge rubber. FIG. 10 is a cross-sectional view of a portion of an exemplary shoe  
14      sole outer comprising micro-cellular closed-cell sponge rubber and non-sponge rubber. FIG. 11  
15      is a bottom view of an exemplary shoe sole outer comprising micro-cellular closed-cell sponge  
16      rubber and non-sponge rubber. In an exemplary shoe sole outer embodiment, blowing agent  
17      Celogen AZ (Uniroyal Chemical, supplier) is used to blow Stealth grade S1 (Supplier: Stone  
18      Age Equipment, Inc., Redlands, California, USA) rubber with a hardness of approximately 72  
19      down to a hardness of approximately 50 on the Shore A scale.

20        In an alternative exemplary shoe sole outer embodiment, uncured micro-cellular closed-  
21      cell sponge rubber would be placed in the shoe sole "tread" indentations 201 in the mold 200;  
22      uncured solid rubber would be placed in the shoe mold 200 on top of the previously placed  
23      uncured micro-cellular closed-cell sponge rubber.

24

## 25      ILLUSTRATIVE EMBODIMENTS

26        Although the present invention has been described in certain specific embodiments,  
27      many additional modifications and variations would be apparent to those skilled in the art. It is,  
28      therefore, to be understood that this invention may be practiced otherwise than as specifically  
29      described. Thus, the embodiments of the present invention described herein should be  
30      considered in all respects as illustrative and not restrictive, the scope of the invention to be  
31      determined by the appended claims and their equivalents rather than the foregoing description.

32

33

34

## 1    WHAT IS CLAIMED IS:

2

3            1.    A method for formulating with relatively hard solid rubber, a micro-cellular  
4    closed-cell sponge rubber for use as an outer tire layer on pneumatic tires, said method  
5    comprising:

6            blowing a relatively hard solid rubber having a first hardness scale measurement with a  
7    micro-cellular closed-cell inducing blowing agent to produce a micro-cellular closed-cell sponge  
8    rubber, wherein the second hardness scale measurement is less than the first hardness scale  
9    measurement.

10

11           2.    A method for manufacturing pneumatic rubber tires, said method comprising:  
12    vulcanizing an outer tire layer comprising micro-cellular closed-cell sponge rubber  
13    formulated from relatively hard solid rubber; and  
14    bonding the outer tire layer to a limited-stretch pneumatic tire lining.

15

16           3.    The method of Claim 2, wherein said outer tire layer further comprising non-  
17    sponge rubber.

18

19           4.    A method for manufacturing pneumatic rubber tires, said method comprising:  
20    molding an outer tire layer of micro-cellular closed-cell sponge rubber formulated from  
21    relatively hard solid rubber; and  
22    bonding the molded outer tire layer to a limited-stretch pneumatic tire lining.

23

24           5.    A method for manufacturing pneumatic rubber tires, said method comprising:  
25    bonding an outer tire layer of micro-cellular closed-cell sponge rubber formulated from  
26    relatively hard solid rubber to a limited-stretch pneumatic tire lining.

27

28           6.    The method of Claim 5 wherein said outer tire layer further comprising non-  
29    sponge rubber.

30

31           7.    A pneumatic rubber tire, said pneumatic rubber tire comprising:

1 an outer tire layer comprising micro-cellular closed-cell sponge rubber formulated from  
2 relatively hard solid rubber wherein the outer tire layer is bonded to a limited-stretch pneumatic  
3 tire lining.

4

5           8.       The pneumatic rubber tire of Claim 7, wherein the outer tire layer further  
6 comprising non-sponge rubber.

7

8           9.       A method for manufacturing an outer tire layer for pneumatic rubber tires, said  
9       method comprising:

vulcanizing an outer tire layer comprising micro-cellular closed-cell sponge rubber  
11 formulated from relatively hard solid rubber.

12

13           10. The method of Claim 9 wherein the outer tire layer further comprising non-  
14       sponge rubber

15

18

19           12. The outer tire layer of Claim 11, wherein the outer tire layer further comprising  
20 non-sponge rubber.

21

22           13.    A method for making micro-cellular closed-cell sponge rubber, said method  
23 comprising:

24 determining a set of performance characteristics desirable for an intended use of a  
25 pneumatic rubber tire, said set of performance characteristics comprising a resiliency factor, a  
26 dampening factor, and a relative hardness factor;

27 determining a rubber formulation having a level of rubber resiliency corresponding to  
28 said resiliency factor;

29 determining a blown rubber formulation having a level of dampening corresponding to  
30 said dampening factor; and

31 determining a blown rubber formulation having a hardness measurement corresponding  
32 to said relative hardness factor.

33

1        14. The method of Claim 13, said method further comprising:  
2                blowing said determined rubber formulation with a micro-cellular closed-cell inducing  
3                blowing agent to produce the blown rubber formulation having a level of dampening  
4                corresponding to said dampening factor and a hardness measurement corresponding to said  
5                relative hardness factor.

6

7        15. A method for manufacturing shoe sole outers, said method comprising:  
8                blowing a relatively hard solid rubber with a micro-cellular closed-cell inducing blowing  
9                agent to produce a micro-cellular closed-cell sponge rubber;  
10                vulcanizing said micro-cellular closed-cell sponge rubber with non-sponge rubber in a  
11                shoe sole outer mold.

12

13        16. A shoe sole outer, said shoe sole outer comprising:  
14                micro-cellular closed-cell sponge rubber; and  
15                non-sponge rubber.

16

17        17. A shoe sole outer, said shoe sole outer comprising:  
18                micro-cellular closed-cell sponge rubber vulcanized in a shoe sole outer mold with non-  
19                sponge rubber.

20

21        18. A rubber outer, said rubber outer comprising:  
22                micro-cellular closed-cell sponge rubber; and  
23                non-sponge rubber.

## INTERNATIONAL SEARCH REPORT

International application No.  
PCT/US01/43696

## A. CLASSIFICATION OF SUBJECT MATTER

IPC(7) :Please See Extra Sheet.

US CL :86/28, 67 A, 102; 152/209 D, 209 R, 209,7; 521/79, 148, 150.

According to International Patent Classification (IPC) or to both national classification and IPC

## B. FIELDS SEARCHED

Minimum documentation searched (classification system followed by classification symbols)

U.S. : 86/28, 67 A, 102; 152/209 D, 209 R, 209,7; 521/79, 148, 150.

Documentation searched other than minimum documentation to the extent that such documents are included in the fields searched

Electronic data base consulted during the international search (name of data base and, where practicable, search terms used)

## C. DOCUMENTS CONSIDERED TO BE RELEVANT

Category*	Citation of document, with indication, where appropriate, of the relevant passages	Relevant to claim No.
X	US 5,147,477 A (MOURI et al) 15 September 1992, col. 3 and 4	1-15 and 18
X	US 6,021,831 A (YAMAUCHI et al) 08 February 2000, abstract and col. 2.	1-15 and 18
X	US 5,181,976 A (IWAFUNE et al) 26 January 1993, cols 5 and 8	1-15 and 18
